

# Structural rules in FL: expressive power and cut elimination.

Nikolaos Galatos

Japan Advanced Institute of Science and Technology (until August)

University of Denver (from September)

[galatos@jaist.ac.jp](mailto:galatos@jaist.ac.jp)

Joint work with A. Ciabattoni and K. Terui

- FL and substructural logics
- Algebraic semantics: residuated lattices and FL-algebras
- Structural rules
- Cut elimination
- Expressive power
- Generating analytic calculi from FL + suitable axioms

# Basic structural rules

Letters  $\alpha, \beta$  denote formulas in the language  $\{\wedge, \vee, \backslash, /, \cdot, 1, 0\}$ ;  $\Gamma, \Sigma, \Pi$  denote *sequences* of formulas, and  $\Psi$  denotes either a formula or the empty set.

# Basic structural rules

Letters  $\alpha, \beta$  denote formulas in the language  $\{\wedge, \vee, \backslash, /, \cdot, 1, 0\}$ ;  $\Gamma, \Sigma, \Pi$  denote *sequences* of formulas, and  $\Psi$  denotes either a formula or the empty set.

$$\frac{\Gamma, \alpha, \beta, \Sigma \Rightarrow \Psi}{\Gamma, \beta, \alpha, \Sigma \Rightarrow \Psi} \text{ (e)} \quad \frac{\Gamma, \alpha, \alpha, \Sigma \Rightarrow \Psi}{\Gamma, \alpha, \Sigma \Rightarrow \Psi} \text{ (c)}$$

$$\frac{\Gamma, \Sigma \Rightarrow \Psi}{\Gamma, \alpha, \Sigma \Rightarrow \Psi} \text{ (i)} \quad \frac{\Gamma \Rightarrow \Psi}{\Gamma \Rightarrow \Psi} \text{ (o)} \quad \text{(w)} = \text{(i)} + \text{(o)}$$

The rules *exchange* (e), *contraction* (c), *left* (i) and *right* (o) *weakening* are called *structural*.

The system **FL** *full Lambek calculus* is obtained from **LJ** by removing all structural rules and adding rules for  $\cdot, \backslash, /, 1, 0$ .

# Residuated lattices

A *residuated lattice*, or *residuated lattice-ordered monoid*, is an algebra  $\mathbf{L} = \langle L, \wedge, \vee, \cdot, \backslash, /, 1 \rangle$  such that

- $\langle L, \wedge, \vee \rangle$  is a lattice,
- $\langle L, \cdot, 1 \rangle$  is a monoid and
- for all  $a, b, c \in L$ ,  $ab \leq c \Leftrightarrow a \leq c/b \Leftrightarrow b \leq a \backslash c$ .

An *FL-algebra* expands a residuated lattice by an extra constant 0. FL denotes the variety of FL-algebras.

Consider the separated structural rule

$$\frac{\alpha, \gamma, \alpha \Rightarrow \quad \beta, \gamma, \beta \Rightarrow \quad \Gamma, \gamma, \alpha, \phi, \beta, \gamma, \Delta \Rightarrow \Psi}{\Gamma, \gamma, \beta, \phi, \alpha, \gamma, \Delta \Rightarrow \Psi}$$

Its interpretation is equivalent to the quasiequation

$$aca \leq 0 \text{ and } bcb \leq 0 \text{ and } cafbcb \leq d \implies cbfac \leq d$$

For the choice of variables  $c$  for  $aca$ ,  $b$  for  $bcb$  and  $f$  for  $cafbcb$  we obtain the equation

$$c'b'f'ac' \leq d$$

where  $c' = c \wedge a \setminus 0 / a$ ,  $b' = b \wedge 0 / cb$  and  $f' = f \wedge ca \setminus d / bc$ .

Alternatively, for the choice of variables  $c$  for  $aca$  and  $c$  for  $bcb$  we obtain the equation

$$c'bf'ac' \leq d$$

where  $c' = c \wedge a \setminus 0 / a \wedge b \setminus 0 / b$  and  $f' = f \wedge ca \setminus d / bc$ .

# Separated equations

For a set of variables  $V$ , we define the set of *separated* formulas (or terms)  $sep(V)$  as the smallest set such that

1.  $\{0, \top\} \cup V \subseteq sep(V)$ , (if  $\top$  is in the language),
2. if  $t_1, t_2 \in sep(V)$ , then  $t_1 \wedge t_2 \in sep(V)$ ,
3. if  $s$  is a  $\{\cdot, \vee, 1\}$ -term with no variable from  $V$  and  $t \in sep(V)$ , then  $s \setminus t, t / s \in sep(V)$ .

# Rules without completion

**Theorem.** The rule

$$\frac{\alpha, \beta \Rightarrow \beta}{\beta, \alpha \Rightarrow \beta} \text{ (we)}$$

is not equivalent to a rule that admits cut elimination.

**Proof (Sketch)** Assume that there is a set of rules  $R$  that is equivalent to  $(we)$  and admits cut elimination. So, there is a proof of  $q, p \Rightarrow q$  from  $p, q \Rightarrow q$  in  $\mathbf{FL} + R$ , where  $p, q$  are propositional variables.

**Fact (using [CT])** There is a cut free proof of  $q, p \Rightarrow v$  from assumptions  $q \Rightarrow v; p, q \Rightarrow v; \dots; p, p, \dots, p, q \Rightarrow v \dots$  in  $\mathbf{FL} + R$ , where  $v$  is a new propositional variable.

So, we have

$$\{p^n q \leq v : n \in \omega\} \models_{\mathbf{FL}_R} qp \leq v.$$

To disprove this, we will construct an algebra  $\mathbf{A}$  in  $\mathbf{FL}_r$  and elements  $a, b, c \in A$  such that  $a^n b \leq c$  for all  $n \in \omega$ , but  $ba \not\leq c$ .

We take  $\mathbf{A}$  to be the totally ordered  $\ell$ -group based on the free group on two generators.

**Fact [Ber]**  $\mathbf{A}$  satisfies: if  $1 \leq x^m \leq y$ , for all  $m \in \omega$ , then  $x^m \leq y^{-1}xy$ , for all  $m \in \omega$ .

Since  $\mathbf{A}$  is based on the free group it is not abelian, hence not archimedean (it is totally ordered). So, there exist elements  $g, h \in A$  with  $1 < g, h$  and  $g^m < h$ , for all  $m \in \omega$ .

By the property of the constructed  $\ell$ -group, we get  $g^m \leq h^{-1}gh$ , namely  $g^m h^{-1} \leq h^{-1}g$ , for all  $m \in \omega$ . Now, let

$$a = g^2, b = h^{-1}, \text{ and } c = h^{-1}g.$$

We have  $a^n b = g^{2n} h^{-1} \leq h^{-1}g = c$ , for all  $n \in \omega$ ; but  $c = h^{-1}g < h^{-1}g^2 = ba$ , because  $1 < g$ , so  $ba \not\leq c$ .

# Open Problems

- Characterize all structural rules that **cannot be completed**.
- Characterize all structural rules that are **equivalent to equations**.  
[Separated rules and rules over a single variable are.]
- Find all equations that are **preserved under the Dedekind-MacNeille completion**.  
[Simple equations and prelinearity are preserved.]
- Characterize the equations that correspond to rules that admit cut elimination.
- Develop more general framework, like hypersequents, and study the expressive power and cut elimination.  
[We can prove standard completeness for all logics of the form  $\mathbf{FL}_e + \text{linearity} + \text{simple rules}$ .]
