Joint work with Parth Gupta, Ndiame Ndiaye, and Louis Wei.

Sergey Norin (McGill)

Complete disorder is impossible.

Every sufficiently large system contains a structured subsystem.

• • • • • • • • • • • •

Complete disorder is impossible.

Every sufficiently large system contains a structured subsystem.

Definition

The Ramsey number $R(k, \ell)$ is the smallest positive integer N such that in any red-blue coloring of the edges of the complete graph on N vertices there exists either a complete subgraph on k vertices with all edges colored red (a red K_k) or a complete subgraph on ℓ vertices with all edges colored blue (a blue K_ℓ).

$R(k,\ell)=R(\ell,k),$	$R(1,\ell)=1$
$R(2,\ell) = \ell \text{ for } \ell \geq 2,$	R(3,3) = 6.

< □ > < □ > < □ > < □ > < □ > < □ >

Complete disorder is impossible.

Definition

The Ramsey number $R(k, \ell)$ is the smallest positive integer N such that in any red-blue coloring of the edges of the complete graph on N vertices there exists either a complete subgraph on k vertices with all edges colored red (a red K_k) or a complete subgraph on ℓ vertices with all edges colored blue (a blue K_ℓ).

$R(k,\ell)=R(\ell,k),$	$R(1,\ell)=1$
$R(2,\ell) = \ell \text{ for } \ell \geq 2,$	R(3,3) = 6.

Theorem (Ramsey, 1929)

 $R(k, \ell)$ exists for all positive integers k and ℓ .

Sergey Norin (McGill)

The Ramsey number $R(k, \ell)$ is the smallest positive integer N such that in any red-blue coloring of the edges of the complete graph on N vertices there exists a red K_k or a a blue K_ℓ .

Theorem (Erdős-Szekeres, 1935)

For all integers $k, \ell \geq 2$

$$R(k,\ell) \leq \binom{k+\ell-2}{k-1}.$$

In particular

 $R(k,k) < 4^k$

Sergey Norin (McGill)

Theorem (Erdős-Szekeres, 1935)

For all integers $k, \ell \geq 2$

$$R(k,\ell) \leq \binom{k+\ell-2}{k-1}.$$

In particular

 $R(k,k) < 4^k$

Theorem (Erdős, 1947)

For all integers $k \ge 2$

$$R(k,k)\geq \sqrt{2}^k.$$

Sergey Norin (McGill)

Upper bounds on the diagonal Ramsey numbers

Upper bounds on the diagonal Ramsey numbers

Theorem (Campos, Griffiths, Morris, and Sahasrabudhe, 2023+) There exists $\delta > 0$ such that

$$\mathsf{R}(\mathsf{k},\mathsf{k}) \leq (4-\delta)^{\mathsf{k}}.$$

(One can take $\delta = 0.007$ for sufficiently large k.)

Our main result

Theorem (Gupta, Ndiaye, N., Wei 2024+) For all positive integers $\ell \leq k$

$$R(k,\ell) \leq e^{G(\ell/k)k+o(k)} \binom{k+\ell}{\ell},$$

where

$$G(\lambda) = \left(-0.25\lambda + 0.03\lambda^2 + 0.08\lambda^3\right)e^{-\lambda}$$

In particular,

 $R(k,k) < (3.8)^k$

for sufficiently large k.

Sergey Norin (McGill)

Erdős-Szekeres proof

Theorem

For all $x \in (0,1)$ and integers $k, \ell \geq 1$

$$R(k,\ell) \leq x^{-k}(1-x)^{-\ell}.$$

Proof

Sergey No

By induction on $k + \ell$. Let $N = R(k, \ell) - 1$. Let v be an arbitrary vertex of K_N colored with no red K_k or blue K_{ℓ} .

Erdős-Szekeres proof

Theorem

For all $x \in (0,1)$ and integers $k, \ell \geq 1$

$$R(k,\ell) \leq x^{-k}(1-x)^{-\ell}.$$

Proof

$$|N_B(v)| \le R(k, \ell - 1) - 1 \le x^{-k}(1-x)^{-\ell+1} - 1$$

3

Erdős-Szekeres proof

Theorem

For all $x \in (0,1)$ and integers $k, \ell \geq 1$

$$R(k,\ell) \leq x^{-k}(1-x)^{-\ell}.$$

Proof

$$\begin{split} |N_B(v)| &\leq x^{-k}(1-x)^{-\ell+1} - 1, \qquad |N_R(v)| \leq x^{-k+1}(1-x)^{-\ell} - 1. \\ R(k,\ell) - 1 &\leq (x^{-k}(1-x)^{-\ell+1} - 1) + (x^{-k+1}(1-x)^{-\ell} - 1) + 1 \\ &= (x + (1-x))x^{-k}(1-x)^{-\ell} - 1 = x^{-k}(1-x)^{-\ell} - 1 \end{split}$$

The protagonist

A pair of disjoint sets of vertices (X, Y) is a candidate. A candidate (X, Y) is (k, ℓ, t) -good if $X \cup Y$ contains a red K_k or X contains a blue K_t or Y contains a blue K_ℓ .

November 25, 2024 9/31

The protagonist

A pair of disjoint sets of vertices (X, Y) is a candidate. $e_R(X, Y)$ is the number of red edges between X and Y. Let $f_p(X, Y) = e_R(X, Y) - p|X||Y|$ be the excess amount of red edges between X and Y when compared to density p.

Convexity

Let
$$f_p(X, Y) = e_R(X, Y) - p|X||Y|$$
.
Lemma

$$\frac{1}{|X|} \sum_{v \in X} f_p(X, N_R(v) \cap Y) \ge p \cdot f_p(X, Y).$$

Lemma

Let 0 < x < p < 1, let k, ℓ and t be positive integers and let (X, Y) be a candidate such that

$$f_{\rho}(X,Y) \ge (k+t)x^{-k}(1-x)^{-\ell}(\rho-x)^{-t}$$

then (X, Y) is (k, ℓ, t) -good.

Let $v \in X$ be such that $f_p(X, N_R(v) \cap Y) \ge p \cdot f_p(X, Y).$

Lemma

If
$$f_p(X, Y) \ge (k + t)x^{-k}(1 - x)^{-\ell}(p - x)^{-t}$$
 then (X, Y) is (k, ℓ, t) -good.

イロト 不得 トイヨト イヨト 二日

Lemma

If
$$f_p(X, Y) \ge (k + t)x^{-k}(1 - x)^{-\ell}(p - x)^{-t}$$
 then (X, Y) is (k, ℓ, t) -good.

Similarly (X_B, Y_R) is not $(k, \ell, t-1)$ -good and and so $f_p(X_B, Y_R) < \frac{k+t-1}{k+t}(p-x)f_p(X, Y).$

< □ > < □ > < □ > < □ > < □ > < □ >

3

Lemma

If $f_p(X, Y) \ge (k + t)x^{-k}(1 - x)^{-\ell}(p - x)^{-t}$ then (X, Y) is (k, ℓ, t) -good.

$$f_{p}(X_{R}, Y_{R}) < \frac{k+t-1}{k+t} x f_{p}(X, Y),$$

$$f_{p}(X_{B}, Y_{R}) < \frac{k+t-1}{k+t} (p-x) f_{p}(X, Y),$$

$$pf_{p}(X, Y) \le f_{p}(X, Y_{R}) = f_{p}(X_{R}, Y_{R}) + f_{p}(X_{B}, Y_{R}) + f_{p}(\{v\}, Y_{R})$$

$$< \frac{k+t-1}{k+t} pf_{p}(X, Y) + |Y|,$$

So $|Y| \ge px^{-k}(1-x)^{-\ell}(p-x)^{-t} \ge x^{-k}(1-x)^{-\ell} \ge R(k,\ell).$

Sergey Norin (McGill)

The off-diagonal result

Lemma

If
$$f_p(X, Y) \ge (k + t)x^{-k}((1 - x)(p - x))^{-\ell}$$
 then (X, Y) is (k, ℓ, ℓ) -good.

3

< □ > < □ > < □ > < □ > < □ >

The off-diagonal result

Lemma

If
$$f_p(X,Y) \ge (k+t)x^{-k}((1-x)(p-x))^{-\ell}$$
 then (X,Y) is (k,ℓ,ℓ) -good.

Theorem

For all
$$rac{\sqrt{5}-1}{\sqrt{5}+1} and all positive integers k and ℓ
$$R(k,\ell) \leq 4(k+\ell) \left(rac{1+\sqrt{5}}{2}p + rac{1-\sqrt{5}}{2}
ight)^{-k/2} (1-p)^{-\ell}.$$$$

By induction on ℓ . Let $(1-x)(p-x) = (1-p)^2$, i.e. $x = \frac{1+\sqrt{5}}{2}p + \frac{1-\sqrt{5}}{2}$. If $|N_B(v)| \gtrsim (1-p)n$ for some v we apply the induction hypothesis to $N_B(v)$, otherwise randomly dividing the vertices we obtain a candidate which is (k, ℓ, ℓ) -good by the lemma.

The off-diagonal result

Theorem

For all
$$rac{\sqrt{5}-1}{\sqrt{5}+1} and all positive integers k and $\ell$$$

$$R(k,\ell) \leq 4(k+\ell) \left(rac{1+\sqrt{5}}{2}p + rac{1-\sqrt{5}}{2}
ight)^{-k/2} (1-p)^{-\ell}.$$

Substituting
$$p = \frac{(\sqrt{5}+1)k + (2\sqrt{5}-2)\ell}{(\sqrt{5}+1)(k+2\ell)}$$
 we get

Theorem

For all positive integers $k \ge \ell$

$$R(k,\ell) \leq 4(k+\ell) \left(rac{\left(\sqrt{5}+1
ight)(k+2\ell)}{4\ell}
ight)^\ell \left(rac{k+2\ell}{k}
ight)^{k/2}$$

Comparison

Let

$$ES(k,\ell) = \binom{k+\ell-2}{k-1} = e^{O(\log k)} \left(\frac{k+\ell}{k}\right)^k \left(\frac{k+\ell}{\ell}\right)^\ell,$$

denote the Erdős-Szekeres upper bound on the Ramsey numbers. Our result implies

$$\frac{R(k,\ell)}{ES(k,\ell)} \leq e^{O(\log k)} \left(\frac{(\sqrt{5}+1)(k+2\ell)}{4(k+\ell)}\right)^{\ell} \left(\frac{(k+2\ell)k}{(k+\ell)^2}\right)^{k/2}$$

э

・ロト ・四ト ・ヨト ・ヨト

Comparison

Let

$$ES(k,\ell) = \binom{k+\ell-2}{k-1} = e^{O(\log k)} \left(\frac{k+\ell}{k}\right)^k \left(\frac{k+\ell}{\ell}\right)^\ell,$$

denote the Erdős-Szekeres upper bound on the Ramsey numbers. Our result implies

$$\frac{R(k,\ell)}{ES(k,\ell)} \leq e^{O(\log k)} \left(\frac{(\sqrt{5}+1)(k+2\ell)}{4(k+\ell)}\right)^{\ell} \left(\frac{(k+2\ell)k}{(k+\ell)^2}\right)^{k/2}$$

This yields an exponential improvement of the Erdős-Szekeres bound whenever $\ell < 0.6989k$.

For $\ell = o(k)$ the improvement is of the order

$$e^{O(\log k)}\left(\frac{\sqrt{5}+1}{4}\right)^{\ell} < e^{-0.21\ell+O(\log k)}.$$

Sergey Norin (McGill)

Final version of the inductive lemma

Theorem

For all $0 < \mu, x, y, p < 1$ such that $x < p^{\frac{1}{1-\mu}}(1-\mu)$ and $(x, y) \in \mathcal{R}_*$ there exists L_0 such that for all positive integers k, ℓ with $\ell \ge L_0$ the following holds. Every red-blue coloring of edges the complete graph on $N \ge x^{-k/2}(\mu y)^{-\ell/2}$ with the density of red edges at least p contains a red K_k or a blue K_ℓ .

Final version of the inductive lemma

Theorem

For all $0 < \mu, x, y, p < 1$ such that $x < p^{\frac{1}{1-\mu}}(1-\mu)$ and $(x, y) \in \mathcal{R}_*$ there exists L_0 such that for all positive integers k, ℓ with $\ell \ge L_0$ the following holds. Every red-blue coloring of edges the complete graph on $N \ge x^{-k/2}(\mu y)^{-\ell/2}$ with the density of red edges at least p contains a red K_k or a blue K_ℓ .

The proof:

• instead of $e_R(X, Y) - p|X||Y|$ we lower bound "higher moments" of density

$$(e_R(X, Y) - p|X||Y|)^r|X|^{1-r}|Y|^{1-r}$$

in the regime $r \to \infty$,

 we use further combinatorial ideas from the Campos-Griffiths-Morris-Sahasrabudhe proof, which, in particular, requires us to occasionally apply the induction hypothesis to a common blue neighborhood of a large set of vertices.

Sergey Norin (McGill)

Descending to a candidate

Theorem

For all $0 < \mu, x, y, p < 1$ such that $x < p^{\frac{1}{1-\mu}}(1-\mu)$ and $(x, y) \in \mathcal{R}_*$ there exists L_0 such that for all positive integers k, ℓ with $\ell \ge L_0$ the following holds. Every red-blue coloring of edges the complete graph on $N \ge x^{-k/2}(\mu y)^{-\ell/2}$ with the density of red edges at least p contains a red K_k or a blue K_ℓ .

Theorem

Let $F : (0,1] \to \mathbb{R}_+$ be smooth and let $M, X, Y : (0,1] \to (0,1)$ be such that $F'(\lambda) < 0, X(\lambda) = (1 - e^{-F'(\lambda)})^{\frac{1}{1-M(\lambda)}} (1 - M(\lambda)), (X(\lambda), Y(\lambda)) \in \mathcal{R},$ and

$$\mathsf{F}(\lambda) > -rac{1}{2} \left(\log X(\lambda) + \lambda \log M(\lambda) + \lambda \log Y(\lambda)
ight)$$

for all $0 < \lambda \leq 1$. Then $R(k, \ell) \leq e^{F(\ell/k)k + o(k)}$ for all $k \geq \ell$.

Sergey Norin (McGill)

Plot of the bound

Plot of $H(\lambda) = G(\lambda)/\lambda$. Our improvement for $R(k, \ell)$ over the classical bound is of the order $\exp(H(\ell/k)\ell)$.

24 / 31

Multicolor Ramsey numbers

The multicolor Ramsey number $R(k_1, \ldots, k_c)$ is the minimum integer N such that every coloring of edges of the complete graph on N vertices in c colors contains a complete subgraph on k_i vertices with all edges colored with color i.

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Multicolor Ramsey numbers

The multicolor Ramsey number $R(k_1, \ldots, k_c)$ is the minimum integer N such that every coloring of edges of the complete graph on N vertices in c colors contains a complete subgraph on k_i vertices with all edges colored with color i.

Theorem

For all $x_1 \dots, x_c \in (0, 1)$ such that $x_1 + \dots + x_c = 1$ and integers $k_1, \dots, k_c \ge 1$ we have

$$R(k_1,\ldots,k_c) \leq x_1^{-k_1}x_2^{-k_2}\ldots x_c^{-k_c}.$$

The upper bound is minimized for $x_i = \frac{k_i}{k_1 + \ldots + k_c}$. In particular, it gives

$$R_c(k) := R(\underbrace{k,\ldots,k}) \leq c^{ck}.$$

c times

Theorem (Gupta, Ndiaye, N., Wei 2024+) For all integers $k, \ell_1, \dots, \ell_c \ge 1$ with $\ell = \ell_1 + \dots + \ell_c$ we have $R(k, \ell_1 \dots, \ell_c)$ $\le 2(k+\ell) \left(\frac{k+2\ell}{k}\right)^{k/2} \left(\frac{(\sqrt{5}+1)(k+2\ell)}{4\ell}\right)^\ell \cdot \prod_{i=1}^c \left(\frac{\ell_i}{\ell}\right)^{-\ell_i}.$

Improves on the classical bound for $\ell \leq 0.69k$.

Lower bound due to Spencer, 1975.

Problem (Conlon, Fox, Sudakov)

Can the lower bound be improved by a constant factor?

Sergey Norin (McGill)

3

< □ > < 同 > < 回 > < 回 > < 回 >

Multicolor Ramsey numbers

$$A^{ck} \leq R_c(k) \leq e^{-\delta_c k} c^{ck}$$

for an absolute constant A.

2

$$A^{ck} \leq R_c(k) \leq e^{-\delta_c k} c^{ck}$$

for an absolute constant A.

The value of A has been recently (2021) improved by Conlon and Ferber, and subsequently by Wigderson and by Sawin.

Thank you!
