

# Mathematics 3Q03: Mid-Term Test 1

Instructor: Dr. D. Pelinovsky

Date: October 4, 2012, 9:30-10:20

NAME: \_\_\_\_\_

STUDENT NUMBER: \_\_\_\_\_

**Instruction:** Textbooks, lecture notes, and McMaster calculators are allowed on the test. The duration of this test is 50 minutes. The test paper has 4 questions, where the marks are specified next to each question. Total marks = 20. For full mark, show all your work.

Problem	Points	Score
<b>1</b>	6	
<b>2</b>	6	
<b>3</b>	6	
<b>4</b>	2	
<b>Total</b>	20	

1. Consider the function

$$f(x, y) = \frac{xy(x^2 + y^4)}{x^2 + y^2}, \quad (x, y) \in \mathbb{R}^2 \setminus \{(0, 0)\}.$$

[2] (a) Show that  $f$  is continuous at  $(0, 0)$  and find the limit

$$f(0, 0) := \lim_{(x, y) \rightarrow (0, 0)} f(x, y).$$

[2] (b) Compute the  $x$ -partial derivative at  $(0, 0)$  by using the definition

$$\frac{\partial f}{\partial x}(0, 0) := \lim_{h \rightarrow 0} \frac{f(h, 0) - f(0, 0)}{h}.$$

[2] (c) Compute  $\frac{\partial f}{\partial x}(x, y)$  by using chain rule and prove that it is continuous at  $(0, 0)$ .

2. Consider the function

$$f(x, y) = x^4 - 2x^2 + y^2 + 3,$$

in the disk  $D = \{(x, y) \in \mathbb{R}^2 : x^2 + y^2 \leq 1\}$ .

- [2] (a) Find critical points by using the first derivative test.
- [2] (b) Identify local minima and maxima in  $D$  by using the second derivative test.
- [2] (c) Find the global minimum and global maximum in  $D$ .

3. Consider the function

$$f(x, y) = e^x \sin(2x - y), \quad (x, y) \in \mathbb{R}^2.$$

- [2] (a) Find the gradient vector of  $f$  at any point  $(x, y)$ .
- [2] (b) Find the directional derivative of  $f$  at the point  $(1, 2)$  in the direction of the line  $y = 3x - 1$ , for increasing values of  $x$ .
- [2] (c) Find the unit direction vector  $\mathbf{u}$  at the point  $(1, 2)$ , along which the function has the maximal increase.

4. TRUE or FALSE:

[1] (a) The function  $Q(x, y) = 3xy + x$  is the quadratic approximation of the function  $f(x, y) = x(1 + y)^3$  at the point  $(0, 0)$ .

[1] (b) If a function  $f(x, y)$  is continuous at the point  $(x_0, y_0)$  in its domain, then it is differentiable at the point  $(x_0, y_0)$ .
