

Lecture 9

Future Directions

Prof Wes Armour

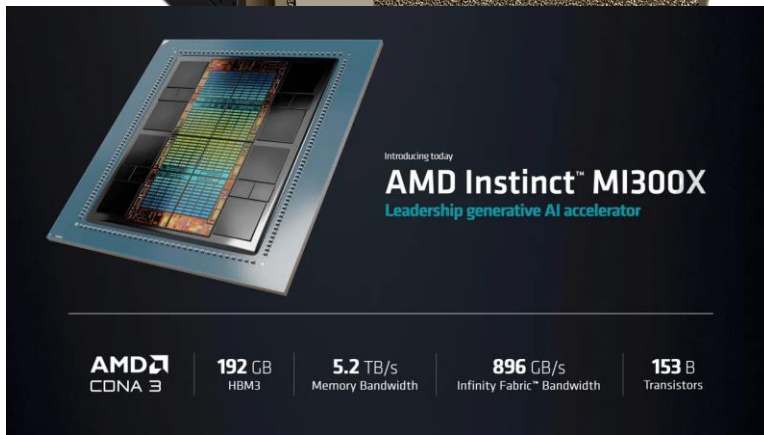

wes.armour@eng.ox.ac.uk

Oxford e-Research Centre
Department of Engineering Science

Learning outcomes

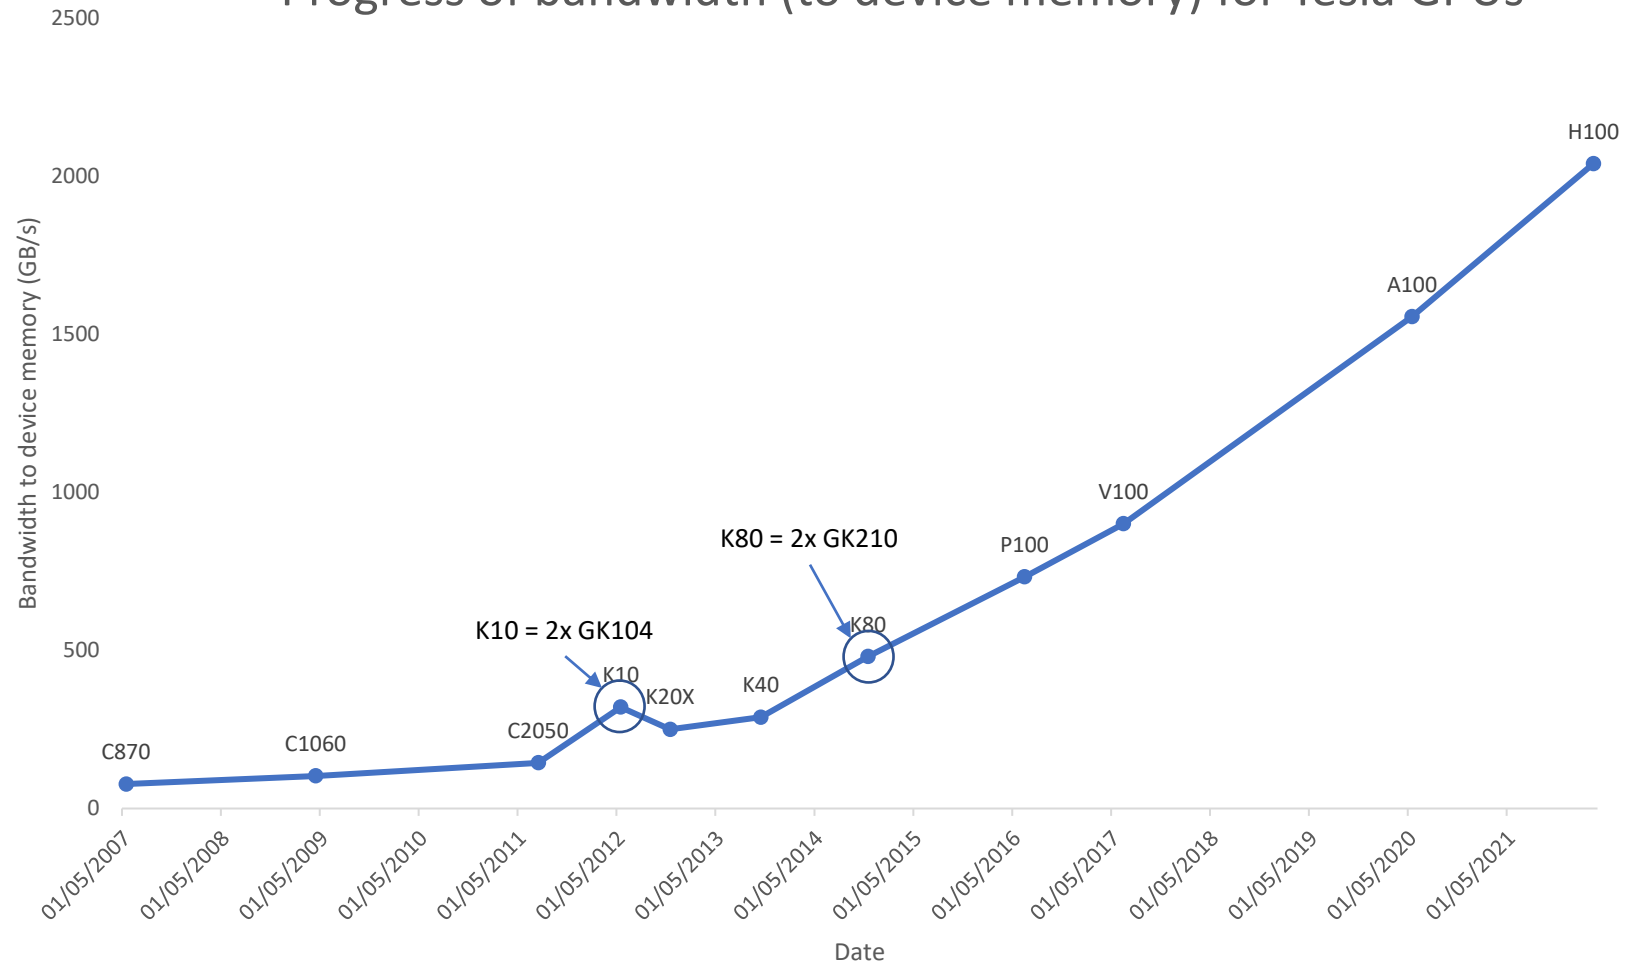

In this lecture we will look at the current landscape of accelerated computing.

We will look at hardware and software trends and potential future directions for accelerated computing.

Bandwidth

Progress of bandwidth (to device memory) for Tesla GPUs

Compute

Progress of single precision (fp32) compute performance for Tesla GPUs

Efficiency

Ratio of compute / bandwidth

The ratio of compute / bandwidth often called **arithmetic intensity** or **operational intensity** (I) tells us how many floating point operations we can perform in the time it takes to move each byte of data from device memory.

$$I = \frac{W}{Q} = \frac{\textit{Work}}{\textit{Memory traffic}} = \frac{\textit{FLOPs}}{\textit{Byte}}$$

Ratio of (peak) compute / bandwidth

We can see from the plot on the right that, although the introduction of new memory technologies reduces operational intensity for short periods, **the overall trend is for it to increase.**

Roofline model

The roofline model tells us, for given hardware, whether our application will be bandwidth bound or compute bound.

Reminder - recompute not transfer

Given the fact that we can now perform so many FLOPs per byte that we move from device memory (e.g. ~100 for a single float on H100), it is worth considering whether it is more efficient to recompute values rather than transferring them.

	1	2	1
$\frac{1}{16}$	2	4	2
	1	2	1

The growing cost of owning NVIDIA

Due to market dominance, commercial interest and the boom in AI, the cost of NVIDIA GPUs has increased significantly.

The plot on the right comes from nextplatform and shows the successive increase in launch price for different generations of GPUs.

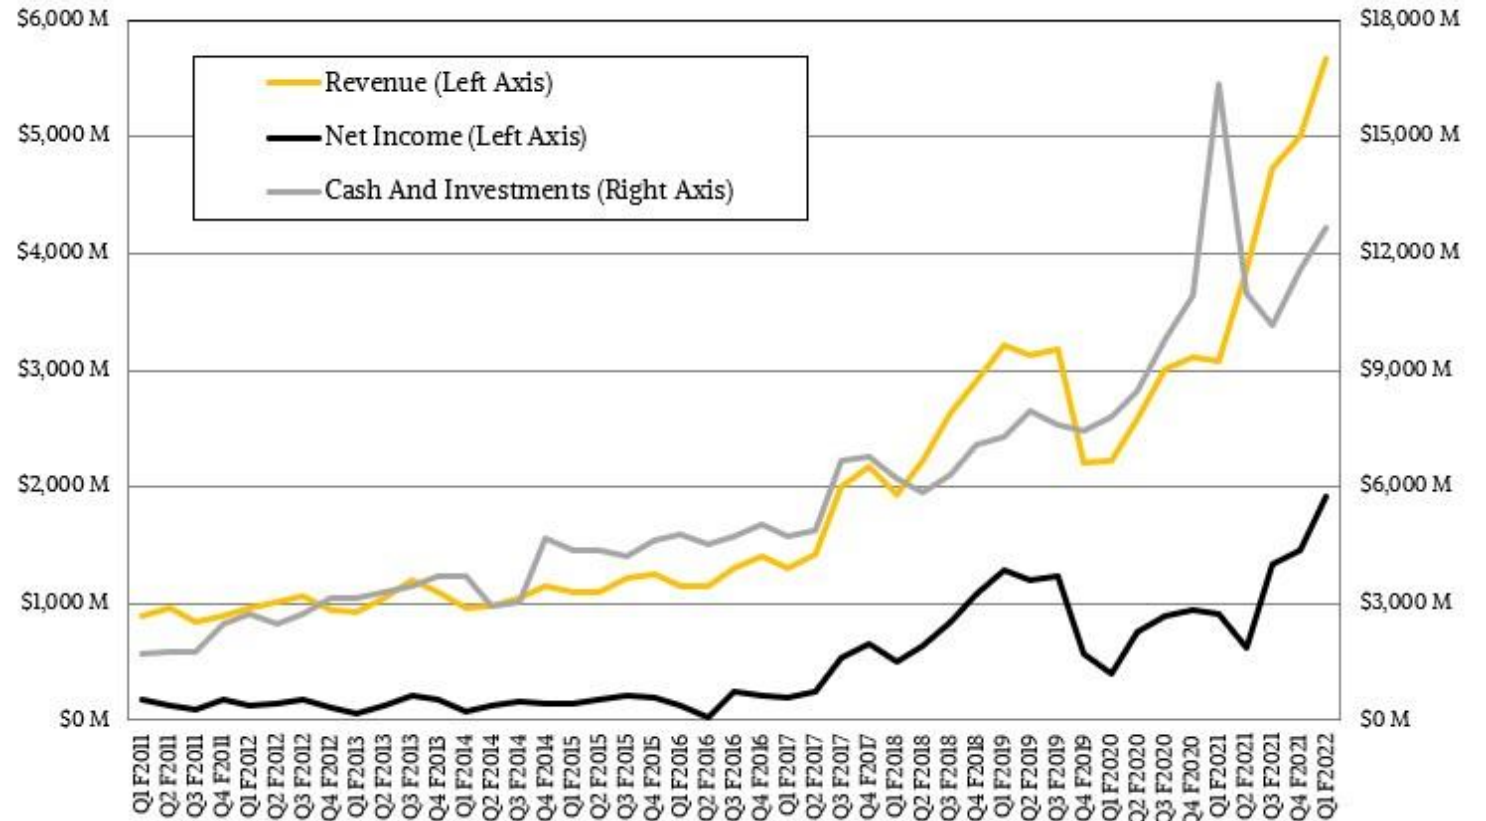

<https://www.nextplatform.com/2022/05/09/how-much-of-a-premium-will-nvidia-charge-for-hopper-gpus/>

The growing cost of owning NVIDIA

Here we see the growth in NVIDIA's revenue over the last decade, again we see in the last few years near exponential growth.

So what does this mean in terms of GPU availability and total cost of ownership.

<https://www.nextplatform.com/2021/05/26/nvidias-next-major-wave-of-ai-revenues/>

Multi-GPU computing

Multi-GPU computing exists at all scales, from cheaper workstations using PCIe, to more expensive Quadro / Titan products using fewer NVLink, to high-end NVIDIA DGX servers.

Single workstation / server:

- a big enclosure for good cooling!
- up to 4 high-end cards in 16x PCIe v4 slots – up to 16GB/s interconnect.
- 2x high-end CPUs.
- 2-3kW power consumption – not one for the office!
- £12K-£18K

NVIDIA DGX H100 Deep Learning server:

- 8 NVIDIA GH100 GPUs, each with 80GB HBM2.
- 2x 56-core Intel Xeons (Platinum 8480C 2.0 GHz).
- 2 TB RAM memory, 8x 3.84TB NVMe.
- 900GB/s NVlink interconnect between the GPUs.
- £???,??? (DGX A100 currently costs ~£350K, launch price was £200K)

Ease of use

Even though we see the **cost of hardware (the CapEx) increasing significantly** (at the moment), **total cost of ownership should also consider the operating costs (OpEx)** and any upfront costs in adopting GPU technologies.

Hopefully during **this week you will have developed a feel for how easy it will be for you to gain GPU acceleration in your projects / codes.**

NVIDIA's rich software ecosystem makes it relatively easy to adopt GPU technology into your codes.

This helps to minimise development time needed to port an existing project to use GPUs.

Tools & Ecosystem

GPU-Accelerated Libraries

Application accelerating can be as easy as calling a library function.

So we should buy NVIDIA right?

If you want to buy **H100 GPUs** in quantity you will be faced with a **4+ month lead time**.

Why? Because there is so much interest in training LLMs / foundational models using NVIDIA GPUs it has generated a supply and demand issue.

Meta alone aim to buy 600,000 H100 GPUs by the end of this year (costing potentially \$10B)

https://www.instagram.com/reel/C2QARHJR1sZ/?utm_source=ig_embed&ig_rid=74e68412-c1ea-4b5f-8e39-d7c0f41d16be

In June 2024 NVIDIA became the worlds most valuable company (for just a few days) reaching the \$3 trillion market cap mark in early June.

Inception initially purchased 22,000 H100s...

Frontier – The worlds first Exaflop machine

Hosted at the Oak Ridge Leadership Computing Facility (OLCF) Tennessee, **Frontier is the worlds only ExaFLOP supercomputer.**

It was delivered in partnership with HPE (Cray) and was also the worlds “greenest” supercomputer when it became operational in May 2022.

<https://www.top500.org/lists/green500/2022/06/>

Great presentation by Bronson Messer
(Director of Science):

<http://www.phys.utk.edu/archives/colloquium/2022/10-03-messer.pdf>

By OLCF at ORNL - <https://www.flickr.com/photos/olcf/52117623843/>, CC BY 2.0,
<https://commons.wikimedia.org/w/index.php?curid=119231238>

Frontier – Compute configuration

The HPE Cray EX rack is a **liquid cooled and blade-based system**. This allows for very high density in a small footprint.

The EX4000 cabinet is a sealed unit that **uses closed-loop cooling to ensure minimal heat is exhausted into the data centre**.

Both Atos and Lenovo have similar technology.

All solutions use direct attached liquid cooled cold plates to remove heat from compute components.

This allows densities of up to 250KW per rack.

<https://www.hpe.com/psnow/doc/a00094635enw>

Frontier – Specs

- 9472 AMD Epyc "Trento" 64 core 2 GHz CPUs.
- 37888 Radeon Instinct MI250X GPUs.
- HPE Slingshot interconnect.
- Frontier is liquid-cooled, allowing 5x the density of an air-cooled architecture.
- Each rack holds 64 blades, each blade has two nodes.
- A node consists of one CPU, 4x GPUs (each having 128GB memory), 512 GB RAM and 4TB of flash memory.
- 21 Megawatts

https://docs.olcf.ornl.gov/systems/frontier_user_guide.html

By OLCF at ORNL - <https://www.flickr.com/photos/olcf/52117623843/>, CC BY 2.0,
<https://commons.wikimedia.org/w/index.php?curid=119231238>

AMD as a solution? Hardware

We see from the change in the top500, **AMD GPUs are now gaining traction in HPC and scientific computing.**

This is because when the **total cost of ownership was considered for both Frontier and LUMI**, it was decided that **AMD GPUs would be more cost effective.**

DoE spent approximately 1/3 of their budget on hardware, the other 2/3 was on software porting and running costs.

A bit more on the MI250X that Frontier uses: 2x 64GB of HBM2e, 3.2TB/s bandwidth, 48TFLOP/s (fp32 and fp64) and 500 Watts TDP.

The new MI300A will be used in the 2 Eflop El Capitan machine

<https://www.amd.com/en/products/specifications/professional-graphics/4476,19496>

AMD as a solution? Cost vs performance

Currently, for a reasonable server expect to pay:

8x H100 server £300K+

8x MI300X server £200K

AMD claims the MI250X is between 1.5x and 2.5x faster than A100 for a range of representative scientific codes (it should be though, it's 18 months newer).

The MI300 is designed to rival the H100. AMDs roadmap has MI325, MI350 and MI400 out to 2026

YMMV...

LAMMPS Molecular Dynamics

Classical molecular dynamics package.

Application	Metric	Test Modules	Bigger is Better	4xMI250	4xA100 (SXM)	MI250/A100
LAMMPS	ATOM-Time Steps/s	Reaxff	Yes	19,482,180.48	8,850,000	Up to 2.2x ²

LSMS Physics

Locally Self-Consistent Multiple Scattering (LSMS) is an order-N approach to the calculation of the electronic structure of large systems.

Application	Metric	Test Modules	Bigger is Better	1xMI250	1xA100 (SXM)	MI250/A100
LSMS	ATOM-Interactions/s	FePt54	Yes	3.95E_09	2.44E+09	Up to 1.6x ³

MILC Physics

Lattice Quantum Chromodynamics (LQCD) codes simulate how elemental particles are formed and bound by the "strong force" to create larger particles like protons and neutrons.

Application	Metric	Test Modules	Bigger is Better	1xMI250	1xA100(SXM)	MI250/A100
MILC	Total Time (Sec)	Apex Medium	No	1,604.6	2,262	Up to 1.4x ¹

OpenMM Molecular Dynamics

High performance, customizable molecular simulation. Times in seconds to complete 8 identical simulations on one GPU.

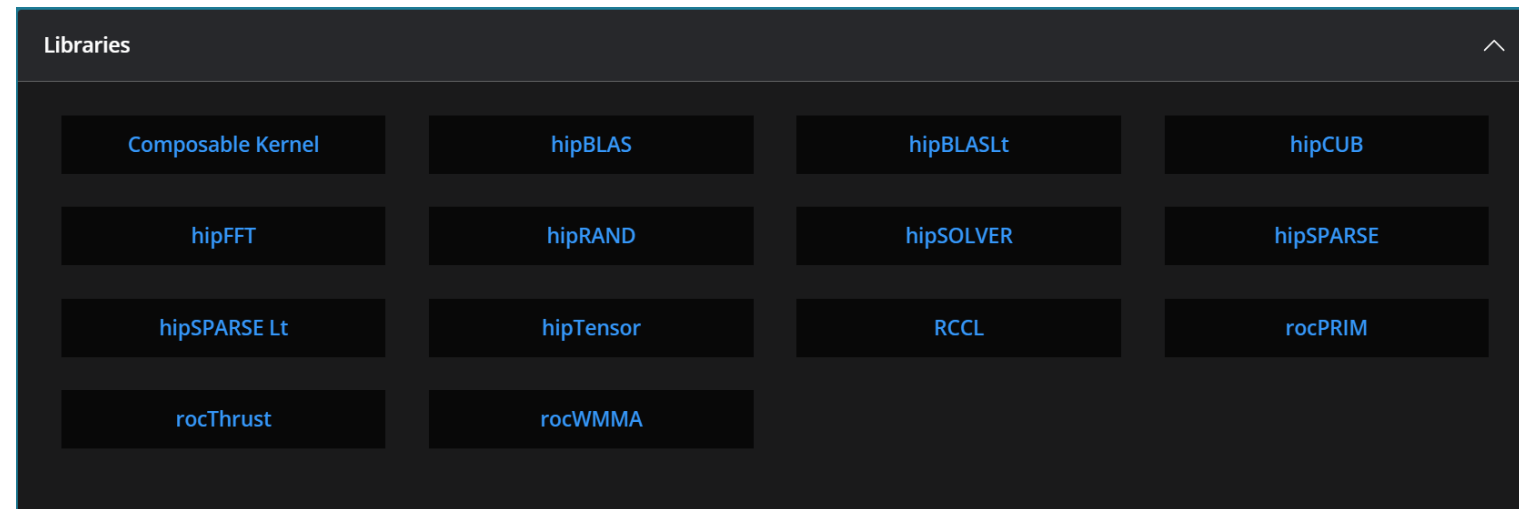

Application	Metric	Test Modules	Bigger is Better	1xMI250	1xA100 (SXM)	MI250/A100
OpenMM	Total Time (Sec) / 10,000 steps	<i>amoebakg</i>	No	387	921	Up to 2.4x ⁴

Software - Radeon Open Compute Platform (ROCm)

One of the reasons **NVIDIA** has been so **dominant in the HPC space** is its **software ecosystem** and its ability to run on basic gaming cards (GeForce), to prosumer (Titan) to high end data centre cards (Tesla).

AMD now has a similar, growing (and in some parts rather familiar) software ecosystem called HIP/ROCm.

<https://www.amd.com/en/graphics/servers-solutions-rocm>

Software - Infinity hub

Have a growing number of leading packages optimised of Instinct. For example:

- Amber
- Gromacs
- Chroma
- QUDA
- CP2K
- PyTorch

Largely driven by DoE contracts.

Heterogeneous-Compute Interface for Portability (HIP)

HIP is AMDs “version” of CUDA, it’s a Kernel Language that looks, in many parts, similar to CUDA.

It **aims** to allow you to **create applications that are portable**, so when you write in HIP, your code will be able to run not only AMD GPUs, but NVIDIA also (at least that’s the aim, just like OpenCL...).

AMD Claim:

- HIP has little (or no) performance impact compared to coding directly in CUDA.
- HIP allows coding in a single-source C/C++ programming language.
- The HIPIFY tools automatically convert most source from CUDA to HIP.
- Developers can specialize for the platform (CUDA or AMD) to tune for performance or handle tricky cases.

<https://github.com/ROCm-Developer-Tools/HIP>

<https://www.youtube.com/watch?v=hSwgh-BXx3E>

<https://www.lumi-supercomputer.eu/preparing-codes-for-lumi-converting-cuda-applications-to-hip/>

Heterogeneous-Compute Interface for Portability (HIP)

Let's look at some HIP (the main() code)...

```
...
char* inputBuffer;
char* outputBuffer;

hipMalloc((void**)&inputBuffer, (strlen + 1) * sizeof(char));
hipMalloc((void**)&outputBuffer, (strlen + 1) * sizeof(char));

hipMemcpy(inputBuffer, input, (strlen + 1) * sizeof(char), hipMemcpyHostToDevice);

hipLaunchKernelGGL(helloworld,
                  dim3(1),
                  dim3(strlen),
                  0, 0,
                  inputBuffer ,outputBuffer );

hipMemcpy(output, outputBuffer, (strlen + 1) * sizeof(char), hipMemcpyDeviceToHost);

hipFree(inputBuffer);
hipFree(outputBuffer);
...
```

Heterogeneous-Compute Interface for Portability (HIP)

Let's look at some HIP (the kernel code)...

```
__global__ void helloworld(char* in, char* out)
{
    int num = hipThreadIdx_x + hipBlockDim_x * hipBlockIdx_x;
    out[num] = in[num] + 1;
}
```

It all looks rather familiar, almost like someone has done a global “find cuda replace with hip”...

HIPIFY

HIPIFY is a set of scripts that will (try) to translate your CUDA source code into HIP automatically for you.

The scripts are based on perl and clang.

Jack tried to take our AstroAccelerate code base (admittedly it is large and in parts quite complicated) and use HIPIFY to generate an AMD executable code.

He wasn't able (through no fault of his own!!).

When Jack emailed support he was pointed to the git repo and asked to raise an issue.

So some work to do before this is truly automagical.

Supported CUDA APIs

- Runtime API
- Driver API
- cuComplex API
- Device API
- RTC API
- cuBLAS
- cuRAND
- cuDNN
- cuFFT
- cuSPARSE
- CUB

<https://github.com/ROCm-Developer-Tools/HIPIFY>

What about Intel?

Whilst Intel didn't invent the idea of a coprocessor, they did popularise it with the x87, dedicated to accelerating and adding functionality for floating point computations.

Since then Intel have had several failed attempts at entering the accelerator computing market.

- i860
- Larabee
- Xeon Phi (MIC)

In 2018 Intel revived the idea of a GPGPU accelerator and this has now become the Intel Xe (eXascaler for everyone).

Intel Xe-HPC - Ponte Vecchio GPU

The **Ponte Vecchio GPU** is used in **Aurora**.

Intel specs are: 45 TFLOP/s, 5 TB/s bandwidth and 2 TB/s connectivity (I think this is Xe Link).

Tests show that **for some applications this reaches about 80% of the performance of an A100**.

We should keep in mind though, that the A100 is four years old, NVIDIAs current flagship GPU is the H100, soon to be replaced by Blackwell.

OneAPI

OneAPI is Intel's answer to HIP. It is an open standard and aims to deliver a single unified API that **can be used across all of its products from FPGAs to GPUs to CPUs.**

It aims to go further than just Intel products. **OneAPI has some functionality for both NVIDIA and AMD GPUs (via Codeplay plugins).**

This work is part of Intel's plan to make oneAPI the preferred alternative for heterogeneous, parallel programming.

One ring to rule them all...

<https://www.intel.com/content/www/us/en/developer/tools/oneapi/code-samples.html#gs.2twqvx>

https://www.eejournal.com/article/intels-latest-version-of-oneapi-takes-advantage-of-new-intel-xeon-improvements-supports-amd-and-nvidia/?cid=org&source=linkedin_organic_cmd&campid=ww_23_oneapi&content=art-idz_&linkId=10000207031089

Google – Tensor Processing Unit

Google offer the TPU. This only suited to AI/ML training, but again, it's not general purpose in the way a CPU or GPU is.

TPUs can be accessed through google cloud. **To use them you write your code in TensorFlow / Torch or JAX and it's compiled to use TPU acceleration.**

TPUs are application specific integrated circuits (ASICs) that focus on the acceleration of matrix operations (performing similar operations to NVIDIA's tensor cores).

<https://arxiv.org/ftp/arxiv/papers/2304/2304.01433.pdf>

<https://cloud.google.com/tpu>

<https://cloud.google.com/tpu/docs/system-architecture-tpu-vm>

Graphcore

Graphcore produce the Colossus Intelligent Processing Unit.

The Mark 2 IPU was released in 2020. The system design is aimed at sparse problems and has a memory system that is ideal for large AI models.

The Mark 3 IPU is still in development, aiming to double the performance of the Mark 2 IPU.

For **certain application spaces** graphcore products are more than competitive with NVIDIA GPUs.

COLOSSUS MK2

the worlds most complex processor

59.4Bn transistors, TSMC 7nm @ 823mm²

250TFlops AI-Float | 900MB In-Processor-Memory

1472 independent processor cores

8832 separate parallel threads

System Price	\$199,000 _{MSRP}	\$259,600 _{MSRP}

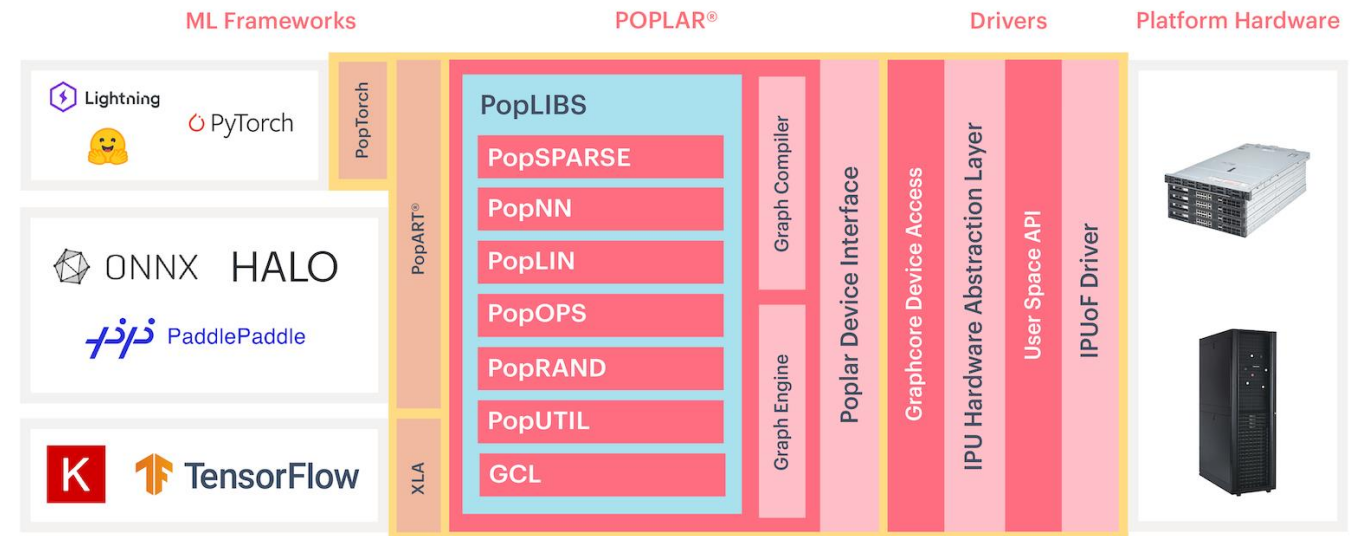

NOTES:
[1] Actual figure for TF32/FP16. NVIDIA BvA100 5PFlop reference is for 50% sparsity which includes PFlops for operations that aren't run
[2] Graphcore AI-Float with IEEE FP16, 16 multiply accumulate and IEEE FP16, 32 16bit float with stochastic rounding, with equivalent accuracy performance as FP32
[3] 40GB HBM memory on A100 modules * 8 modules per DGX-A100 system
[4] IPU-Exchange Memory which includes attached DRAM and IPU in-processor-memory with 100x bandwidth vs. HBM memory sub-system

Graphcore - software

Graphcore have a **software stack called Poplar.**

This will take **code written using TensorFlow, PyTorch and Keras** and generate code to run on the IPU.

But be aware – the IPUs cannot do anything else. They are designed specifically for AI/ML training and work really well in areas such as NLP where models need large memory capacity close to the compute.

Cerebras

Cerebras produce **wafer level processors**. - Quite amazing.

In terms of **software**, Cerebras has a similar approach to Graphcore. It has the **Csoft environment**. It too integrates Torch and TensorFlow to produce code that runs on the WSE-3 platform.

It also has a **SDK to allow developers to write custom kernels**.

I haven't seen a good comparison to other technology as yet.

Traditional Memory Architecture

Cerebras Memory Architecture

Memory uniformly distributed across cores

■ Core ■ Memory

Cerebras WSE

1.2 Trillion transistors
46,225 mm² silicon

Largest GPU

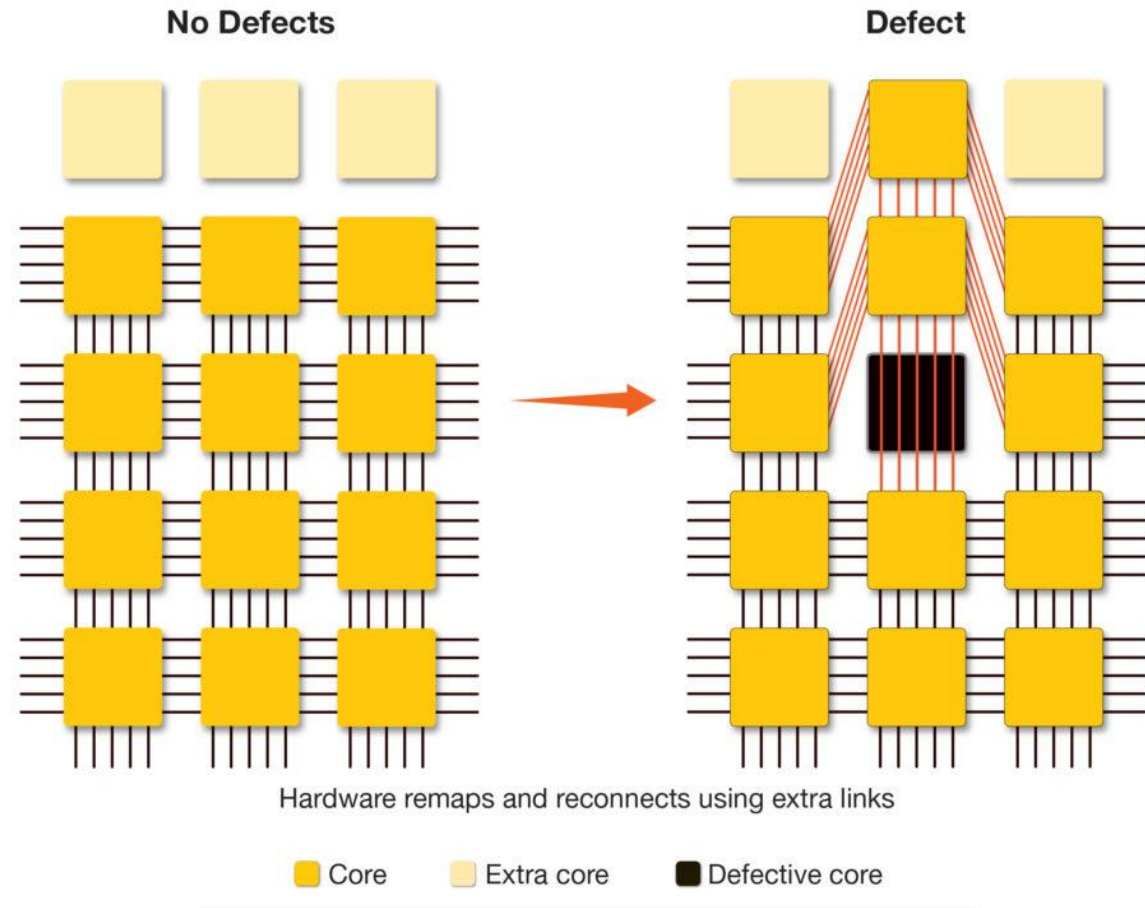

21.1 Billion transistors
815 mm² silicon

Cerebras

From a 12 inch wafer Cerebras produce a single processor (NVIDIA would get about 60 H100).

For those interested –
TSMC can produce ~ 8K wafers per month*

To ensure high yield, defective cores are identified the time of manufacturing and then the interconnect between cores is configured to avoid defective cores. Then added for that chip.

*CoWoS, TSMC has capacity to produce ~15M wafers per year.

<https://www.cerebras.net/blog/wafer-scale-processors-the-time-has-come/#:~:text=A%20wafer%20is%20a%20circle,called%20scribe%20lines%20between%20them.>

Cerebras and G42

Cerebras supplied G42 (UAE AI company) 3x Condor Galaxy systems as part of \$100M deal.

A single CG system is capable of 4 EFLOP (fp16), has 54M Cerebras cores and 82TB of memory.

More on CG here:

<https://www.condorgalaxy.ai/>

Access to CG-1 here:

<https://www.cerebras.net/product-cloud/>

The latest CS-3 computer is being developed with Dell.

G42 **Condor Galaxy 1 AI Supercomputer** **cerebras**

 64 CS-2 nodes	 54 million AI cores	 4 exaFLOPS AI compute at FP16	 82 TB parameter memory	 388 Tbps internal bandwidth	 72,704 AMD EPYC™ cores	 10 days to first training run
--	--	---	--	---	--	---

The infographic features a large image of a server rack at the bottom, composed of multiple grey server units with orange vertical accents.

NVIDIA – Grace-Hopper

Grace-Hopper is NVIDIA's answer to the likes of Cerebras and Graphcore. The “Superchip” combines a Grace CPU and a Hopper GPU using NVLink C2C to deliver a CPU+GPU coherent memory model. The fruition of project Denver begun by NVIDIA in (Circa) 2014.

This kind of design will be crucial in progressing exascale computing in the years to come.

Whitepaper:

<https://resources.nvidia.com/en-us-grace-cpu/nvidia-grace-hopper>

NVIDIA – Grace-Hopper

NVIDIA Grace + Hopper:

- 72x Arm Neoverse V2 cores (4×128-bit SIMD units per core).
- Up to 117 MB of L3 Cache.
- Up to 512 GB of LPDDR5X memory (546 GB/s of memory bandwidth).
- Up to 64x PCIe Gen5 lanes.
- NVIDIA Scalable Coherency Fabric (SCF) mesh and distributed cache with up to 3.2 TB/s memory bandwidth.
- NVIDIA Hopper GPU.
- NVIDIA NVLink-C2C - Up to 900 GB/s total bandwidth.
- Unified address space - each Hopper GPU can address up to 608 GB of memory within a superchip.
- NVIDIA NVLink Switch System connects up to 256x NVIDIA Grace Hopper Superchips using NVLink 4.
- Each NVLink-connected Hopper GPU can address all HBM3 and LPDDR5X memory of all superchips in the network, **for up to 150 TB of GPU addressable memory.**

DGX GH200 AI Supercomputer

The DGX GH200 was announced at Computex May 2023. It's NVIDIA's answer to the likes of Cerebras.

It connects 256 Grace-Hopper “superchips” via NVLink.

- **Single 144 terabytes GPU memory space.**
- **900 GB/s GPU-to-GPU bandwidth.**
- **1 exaFLOPS of FP8 AI performance.**

Whilst aimed at AI, this is a general purpose machine and so could be used for other areas of scientific computing.

<https://nvidianews.nvidia.com/news/nvidia-announces-dgx-gh200-ai-supercomputer>

<https://resources.nvidia.com/en-us-dgx-gh200/nvidia-dgx-gh200-datasheet-web-us>

The future?

High	155.81	P/E ratio	221.07	52-wk high	227.30
Low	150.62	Div yield	-	52-wk low	93.12

The future?

Intel, failed to deliver Aurora, originally contracted to be completed by 2018, First phase has now been delivered, when complete, should be 2 ExaFLOP machine. Each node has 2x Intel Sapphire Rapids (CPU) and 6x Ponte Vecchio GPUs.

Out of the three Intel is worth the least!

Market Summary > Intel Corp

140.40 billion USD

Market capitalisation

32.98 USD

Low	32.85	Div yield	1.52%	52-wk low	29.73

The future?

It's likely due to the cost of NVIDIA and shortage of supply that AMD will get a growing fraction of the accelerator market, especially given that they seem to be following (very closely!) NVIDIAs strategy – a great software ecosystem.

The HPE El Capitan supercomputer, due to be delivered Q4 2024 is an upcoming exascale supercomputer, hosted at the Lawrence Livermore, will be a 2+ ExaFLOP supercomputer and will displace Frontier as the world's fastest supercomputer.

- It's based on... AMD.

Summary

This lecture has looked at some present alternatives to NVIDIA and CUDA. We've also taken a look at some up-coming technologies, both software and hardware that might be worth watching out for over the coming years.

Lots of what you have learnt this week is transferable!

Also keep an eye on Mikes computing webpage here:
